

The yield is clear. The product is not.

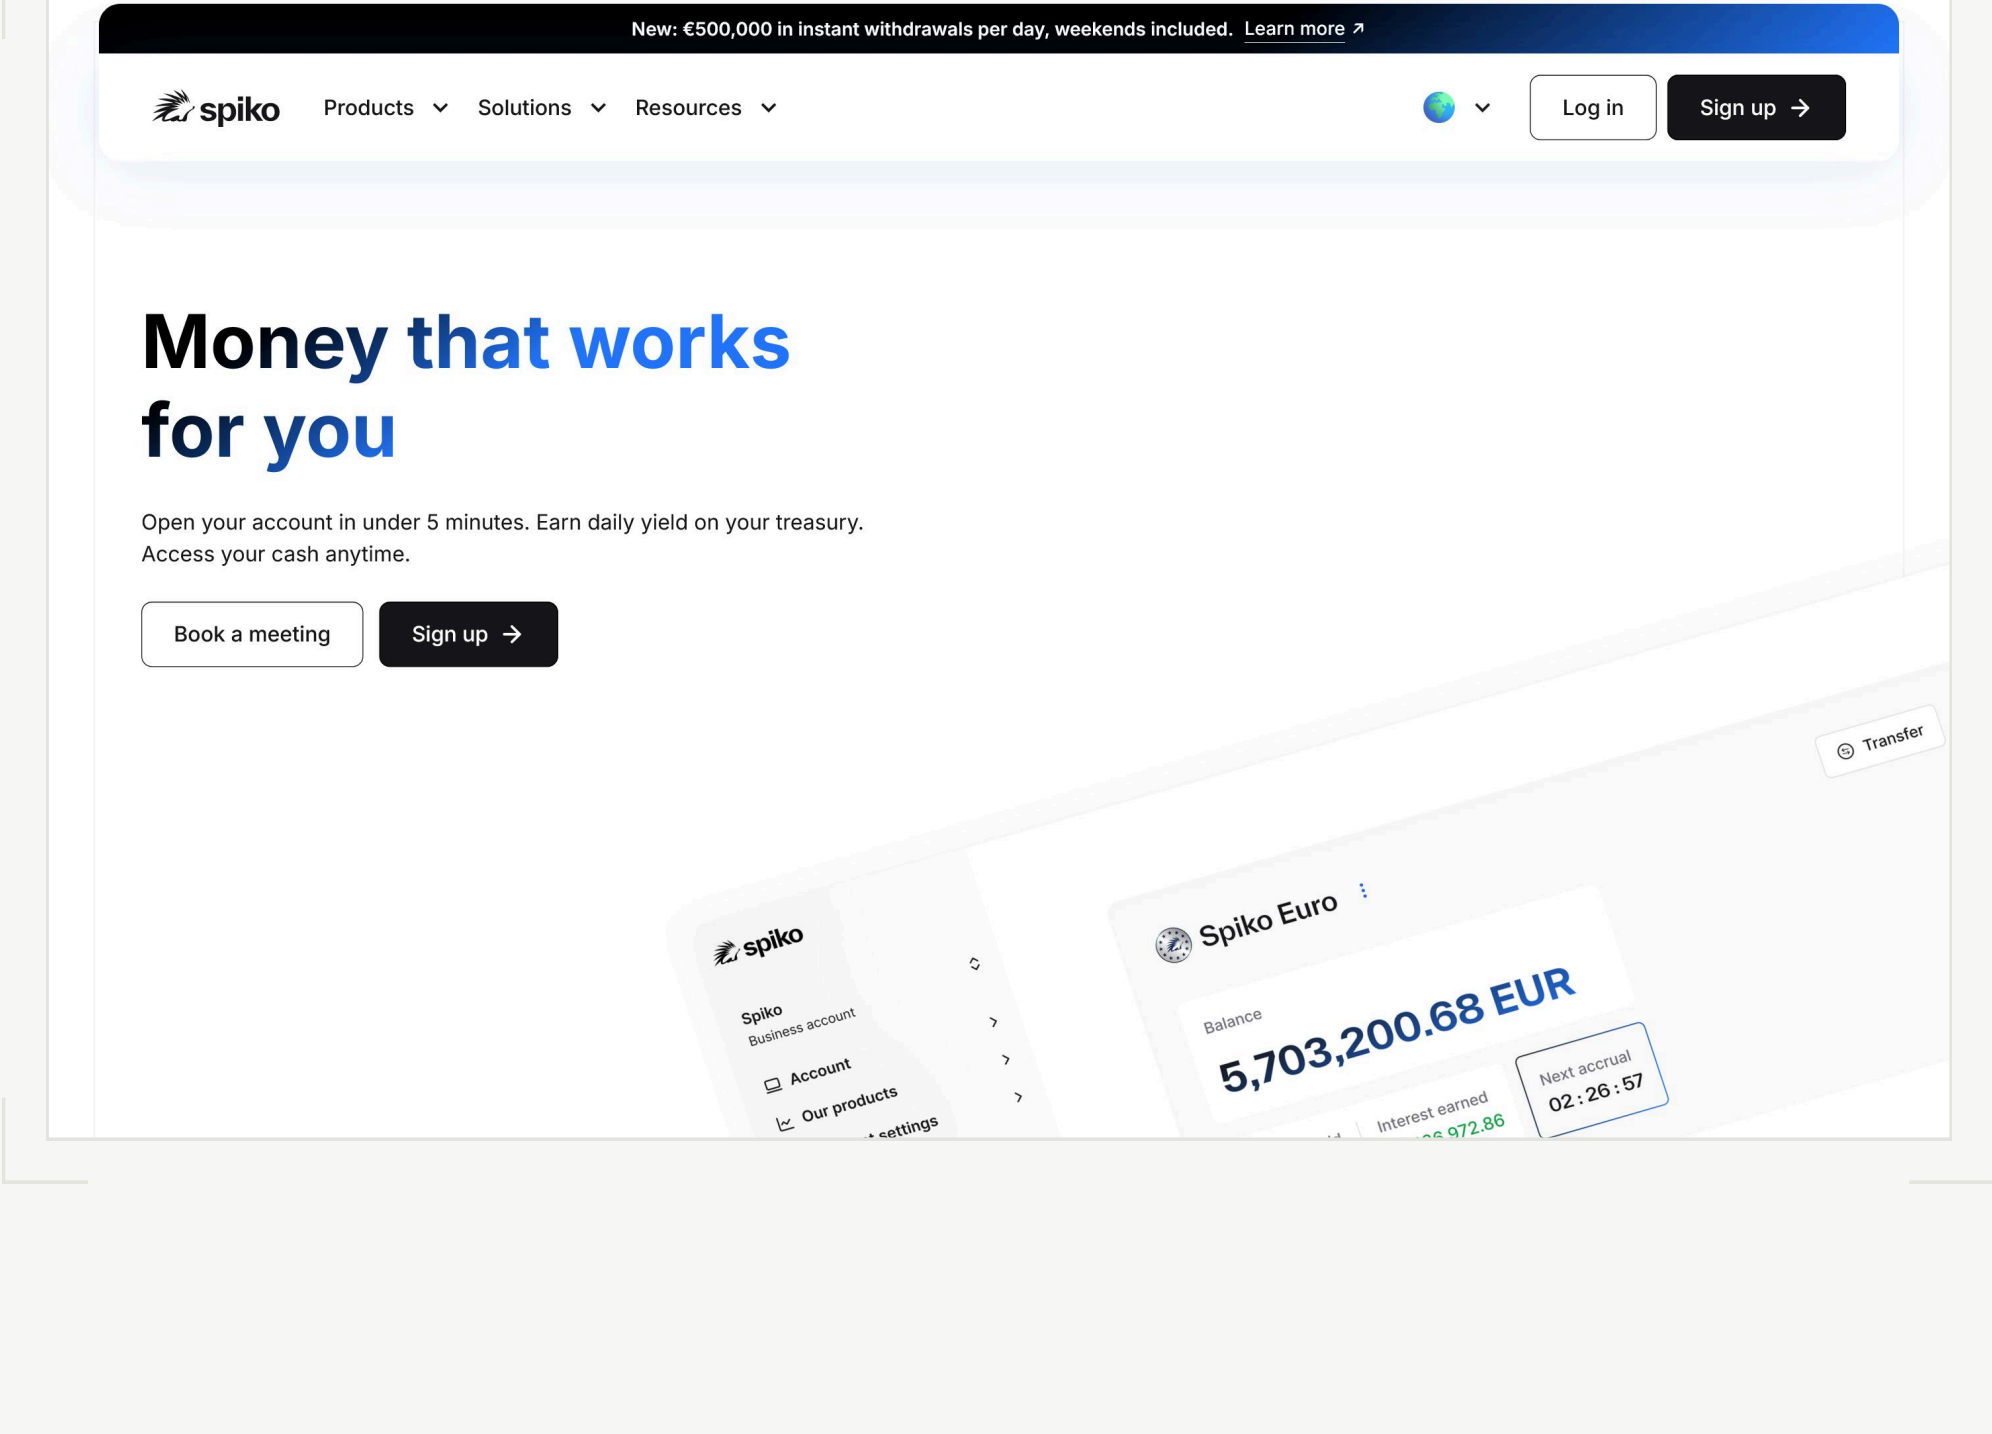

6 observations on how Spiko communicates yield, transparency, trust and product usage before fully explaining the system behind them.

TARGET

Business cash-management users / treasury decision-makers

LOOKING FOR

A clear cash-management product where yield, access, costs and protection are easy to understand.

02-EXECUTIVE-SUMMARY

The yield is clear. The product is not.

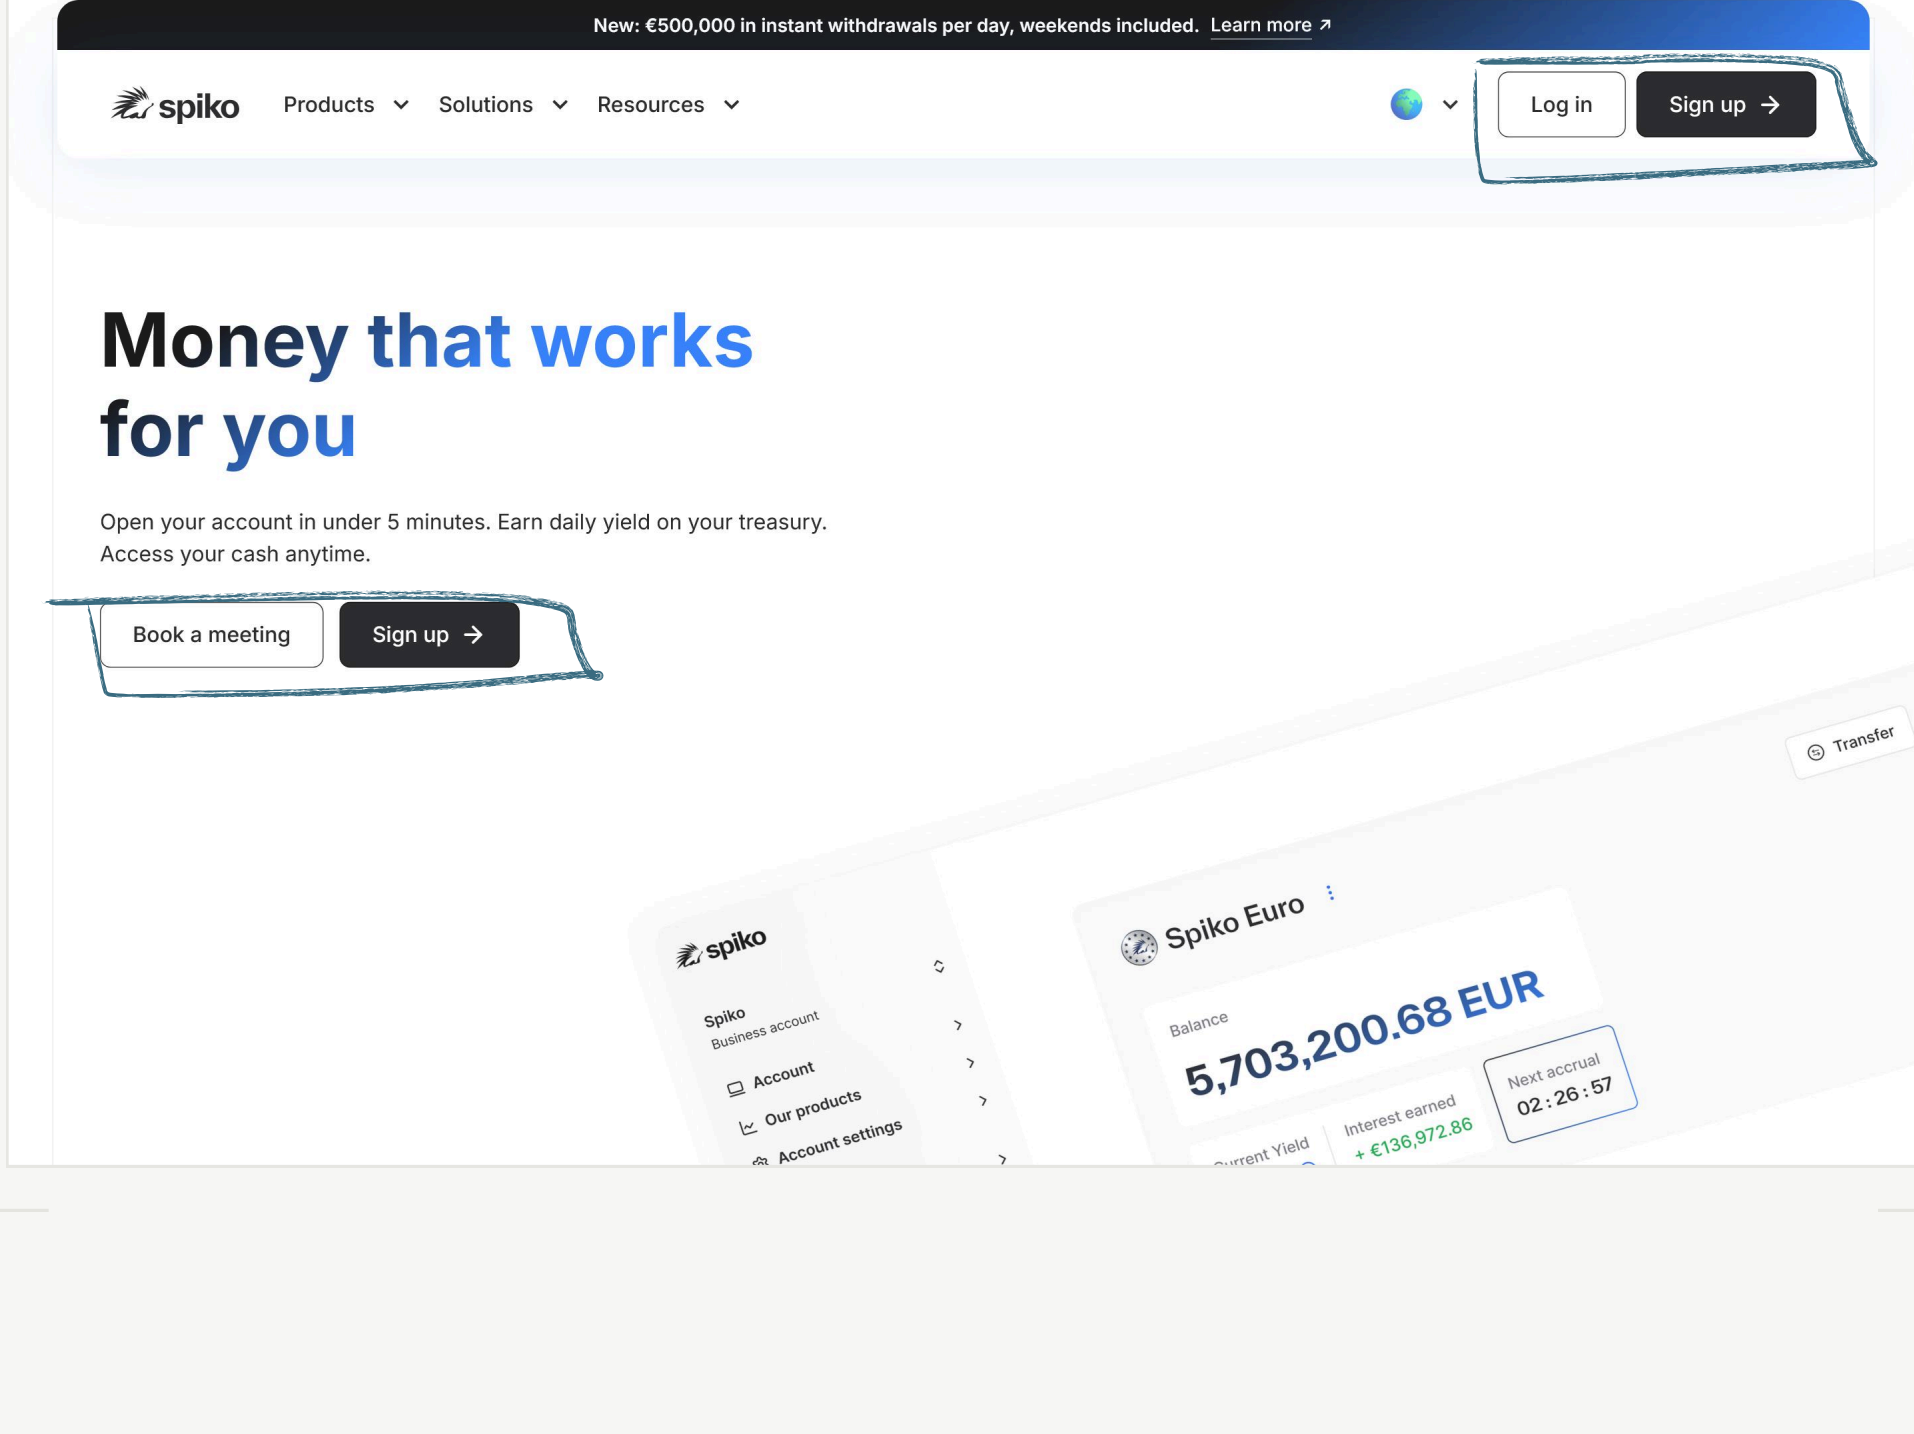

Spiko makes the financial outcome tangible through visible yield, daily accrual and a return calculator. The product model behind that outcome requires more interpretation.

Main observation

The homepage answers how much users can earn before clearly explaining how the product works and what using it involves.

03-OBSERVATION-01

Too many actions compete before one reason to act.

WHAT HAPPENS

The first screen presents Log in, Sign up, Book a meeting and another Sign up while the main value proposition is still being established.

WHY IT MATTERS

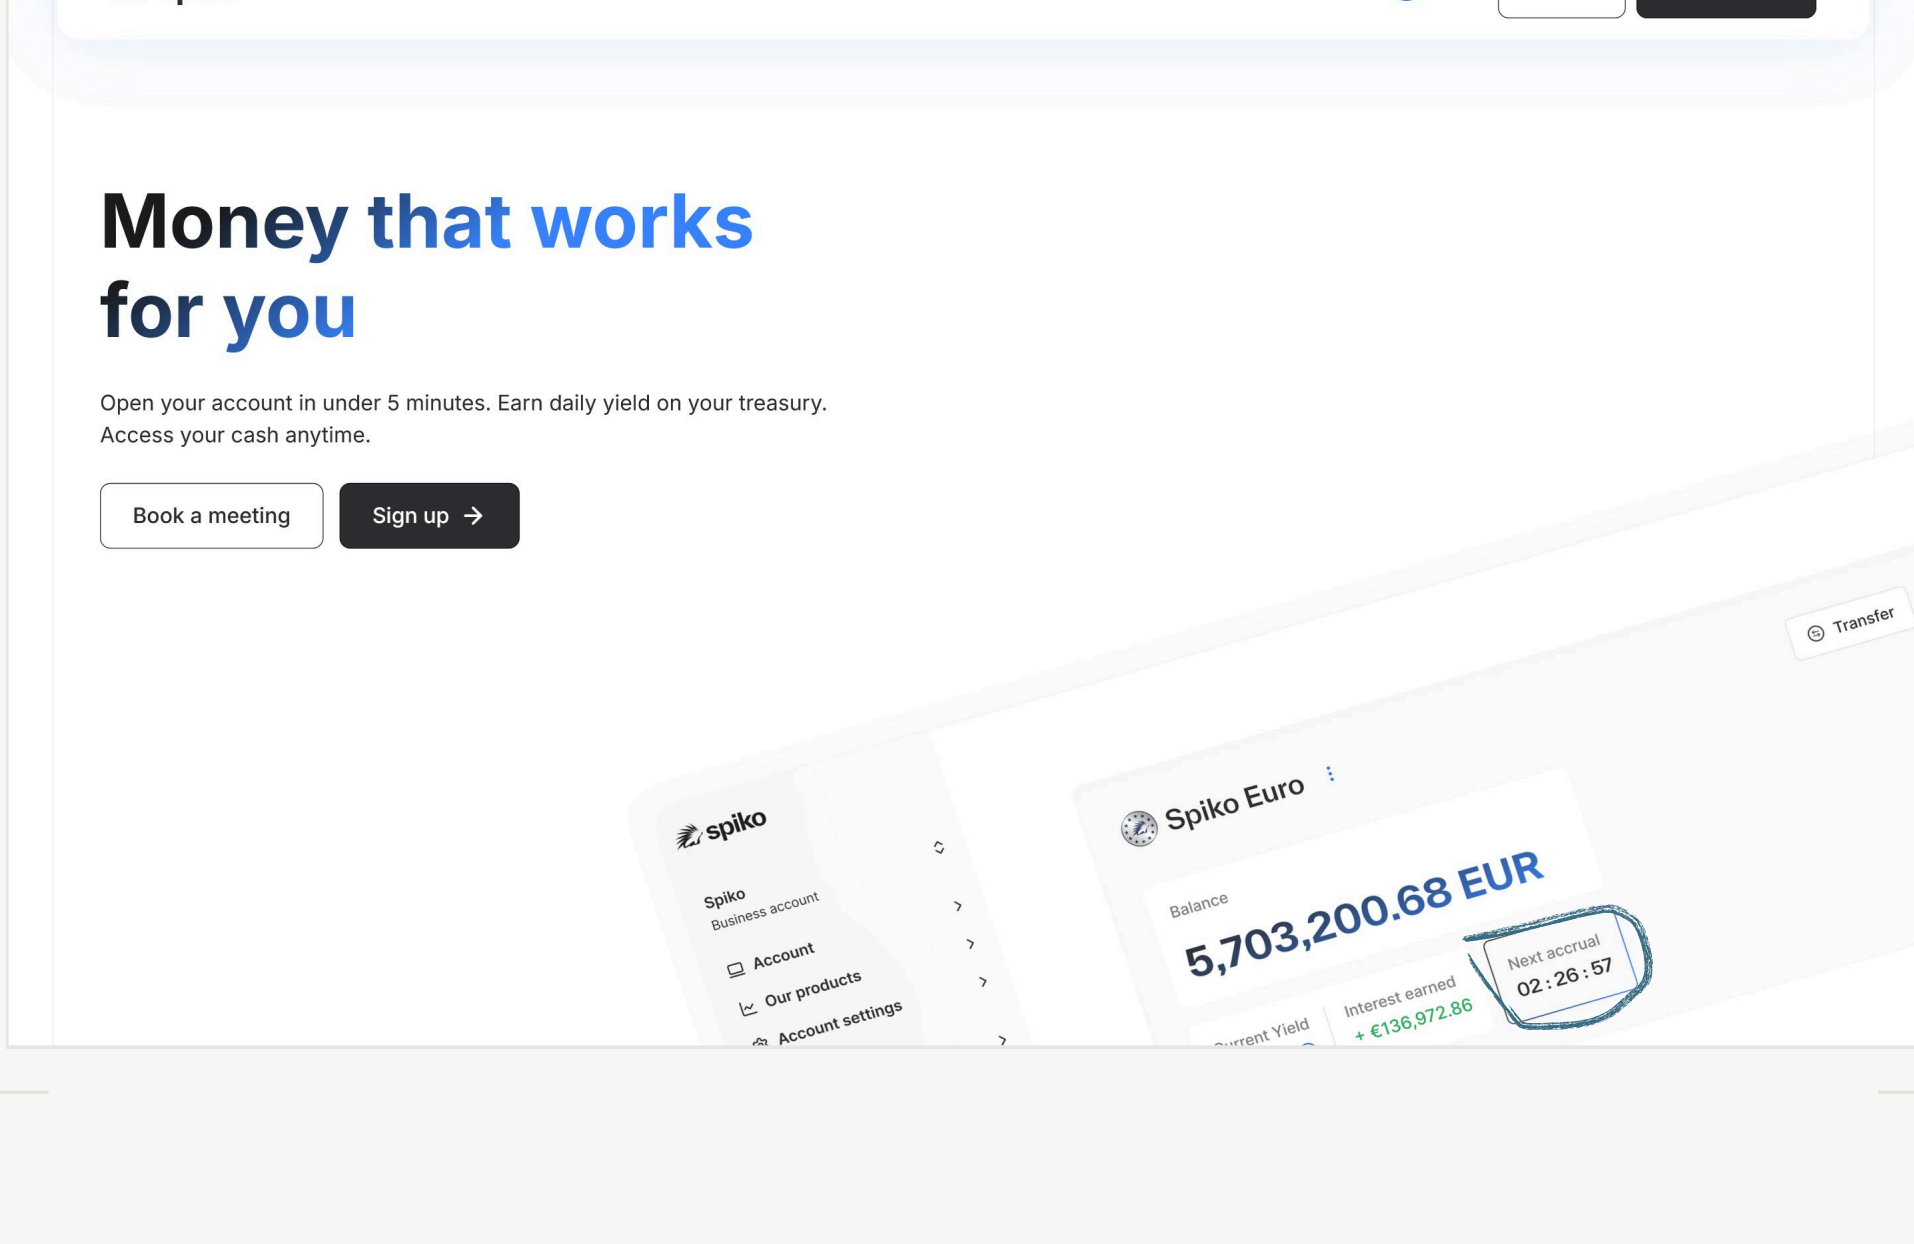

The visitor has to decide which action matters before the page has clearly established why Spiko is worth using.

BUSINESS IMPACT

Several competing entry points dilute the strongest conversion path and make the first interaction depend on prior understanding.

04-OBSERVATION-02

Useful product detail is discovered rather than explained.

WHAT HAPPENS

The product interface shows balance, yield and a "Next accrual" timer, communicating that interest is accruing transparently.

WHY IT MATTERS

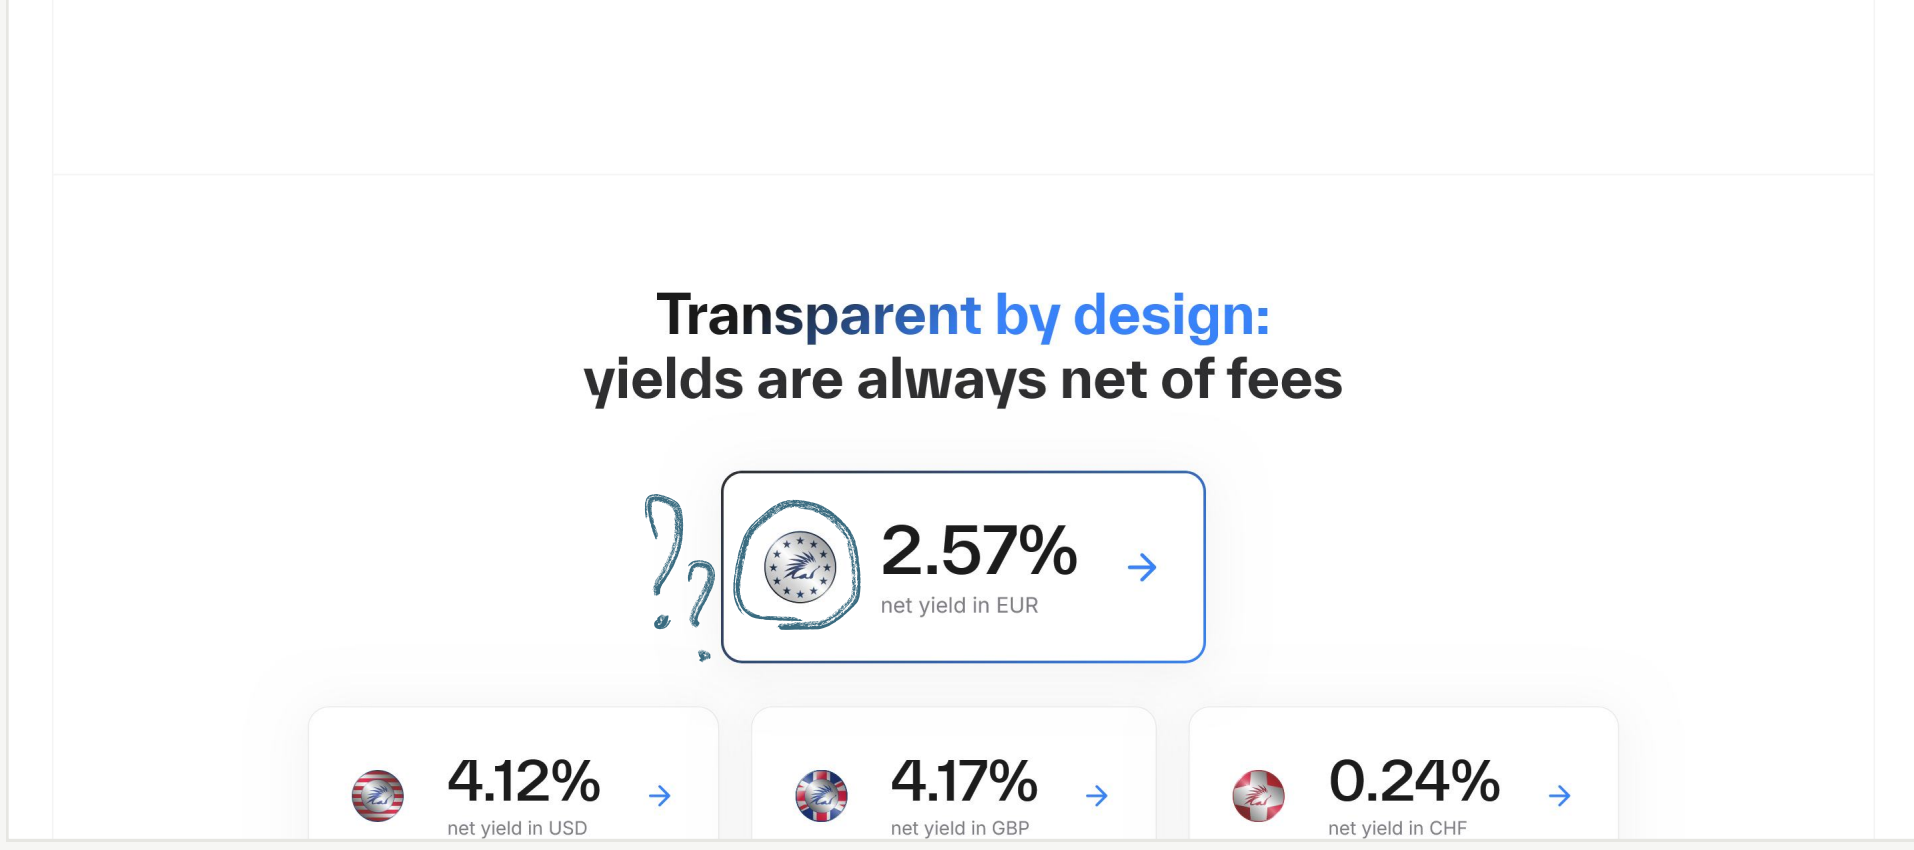

This is one of the clearest demonstrations of the product promise, but the visitor has to notice it independently.

BUSINESS IMPACT

Strong product evidence risks functioning as interface detail instead of helping visitors understand the value proposition.

05-OBSERVATION-03

The currency representation creates an avoidable question.

WHAT HAPPENS

Yield cards and the calculator use distinctive currency-like symbols instead of familiar currency representations.

WHY IT MATTERS

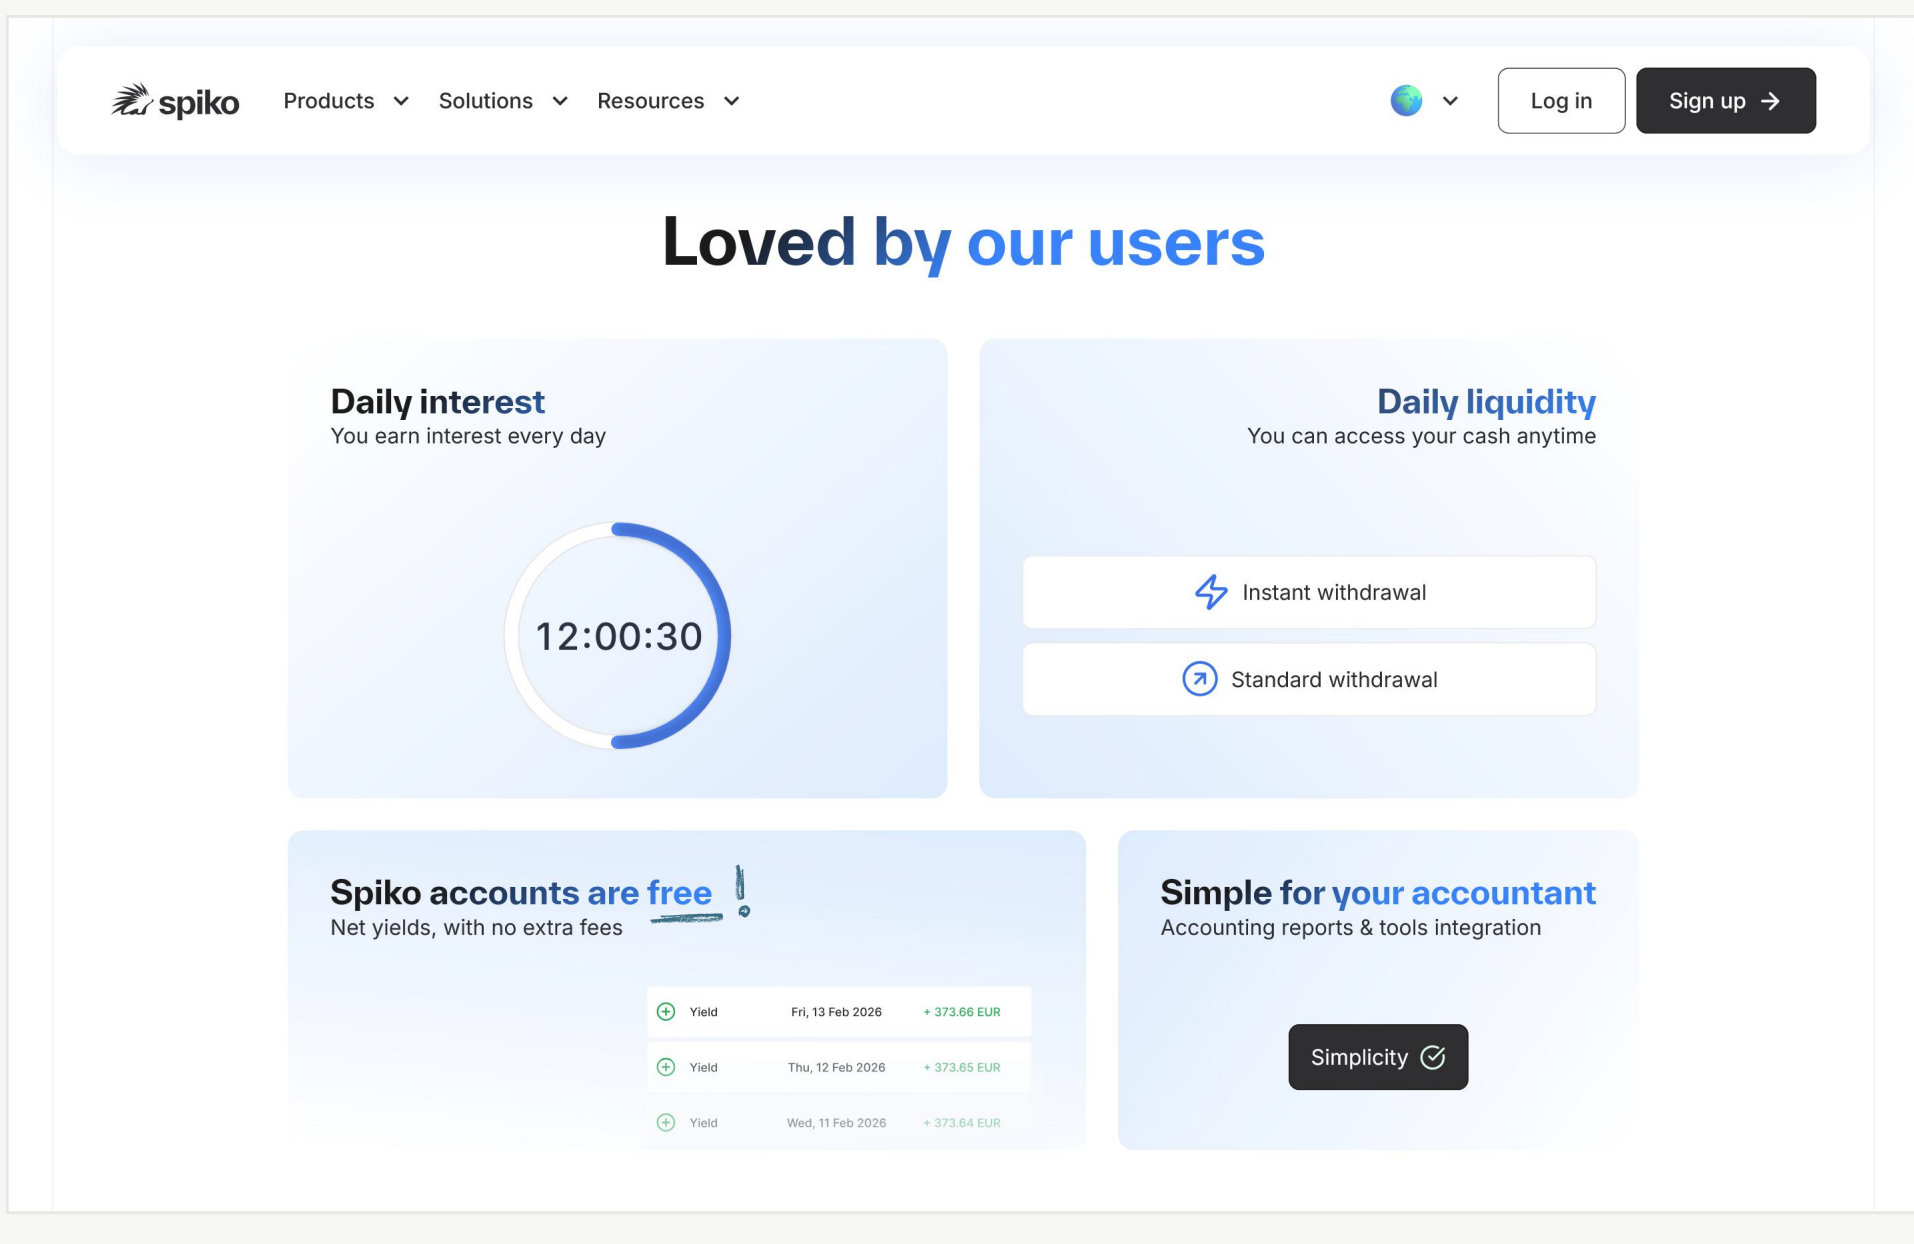

The visitor can understand the percentages while still wondering whether the symbols represent real currencies, product units or something specific to Spiko.

BUSINESS IMPACT

A visual distinction intended to identify the product introduces uncertainty around the basic thing being shown: the money itself.

06-OBSERVATION-04

Yield is transparent, but the withdrawal cost remains unclear.

WHAT HAPPENS

Spiko states that yields are net of fees and presents accounts as free. The calculator then shows potential earnings without clearly resolving the cost of withdrawing money.

WHY IT MATTERS

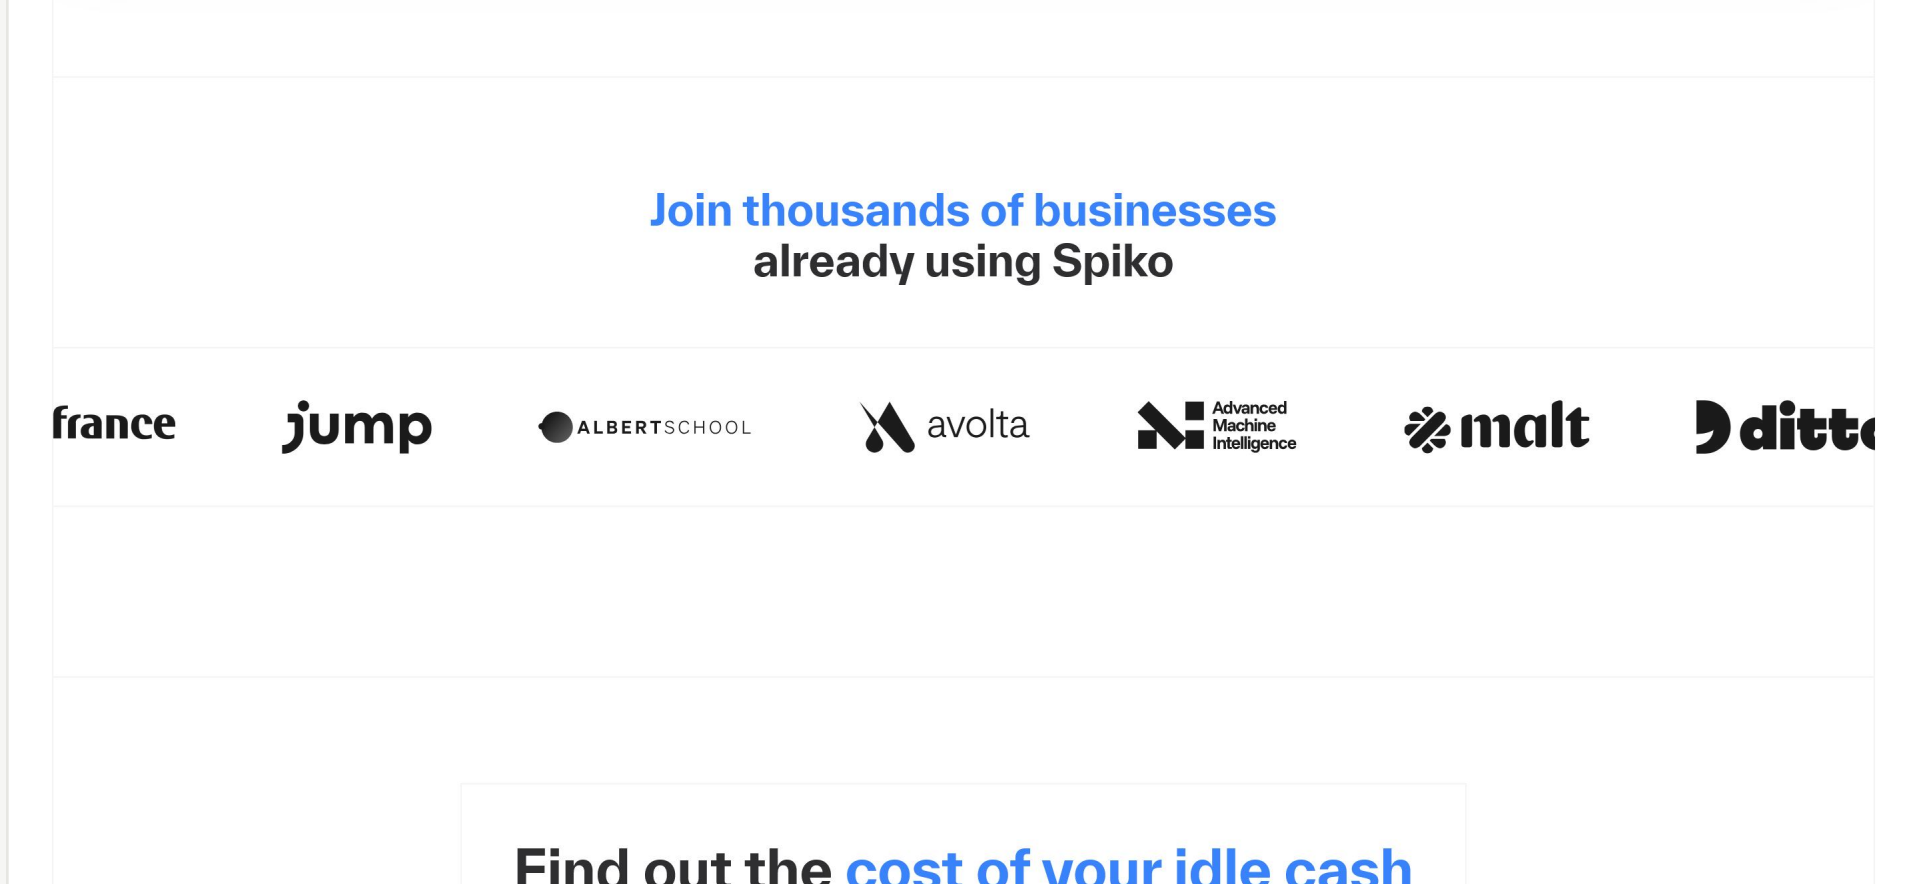

Once the product emphasises transparent yield and free accounts, the natural next question becomes what happens when money leaves the product.

BUSINESS IMPACT

The page creates a strong expectation of cost transparency without fully closing an important part of the decision.

07-OBSERVATION-05

The intended user is not consistently clear.

WHAT HAPPENS

The homepage presents an accessible cash-management proposition, business accounts, company usage and broader messaging about who Spiko is for.

WHY IT MATTERS

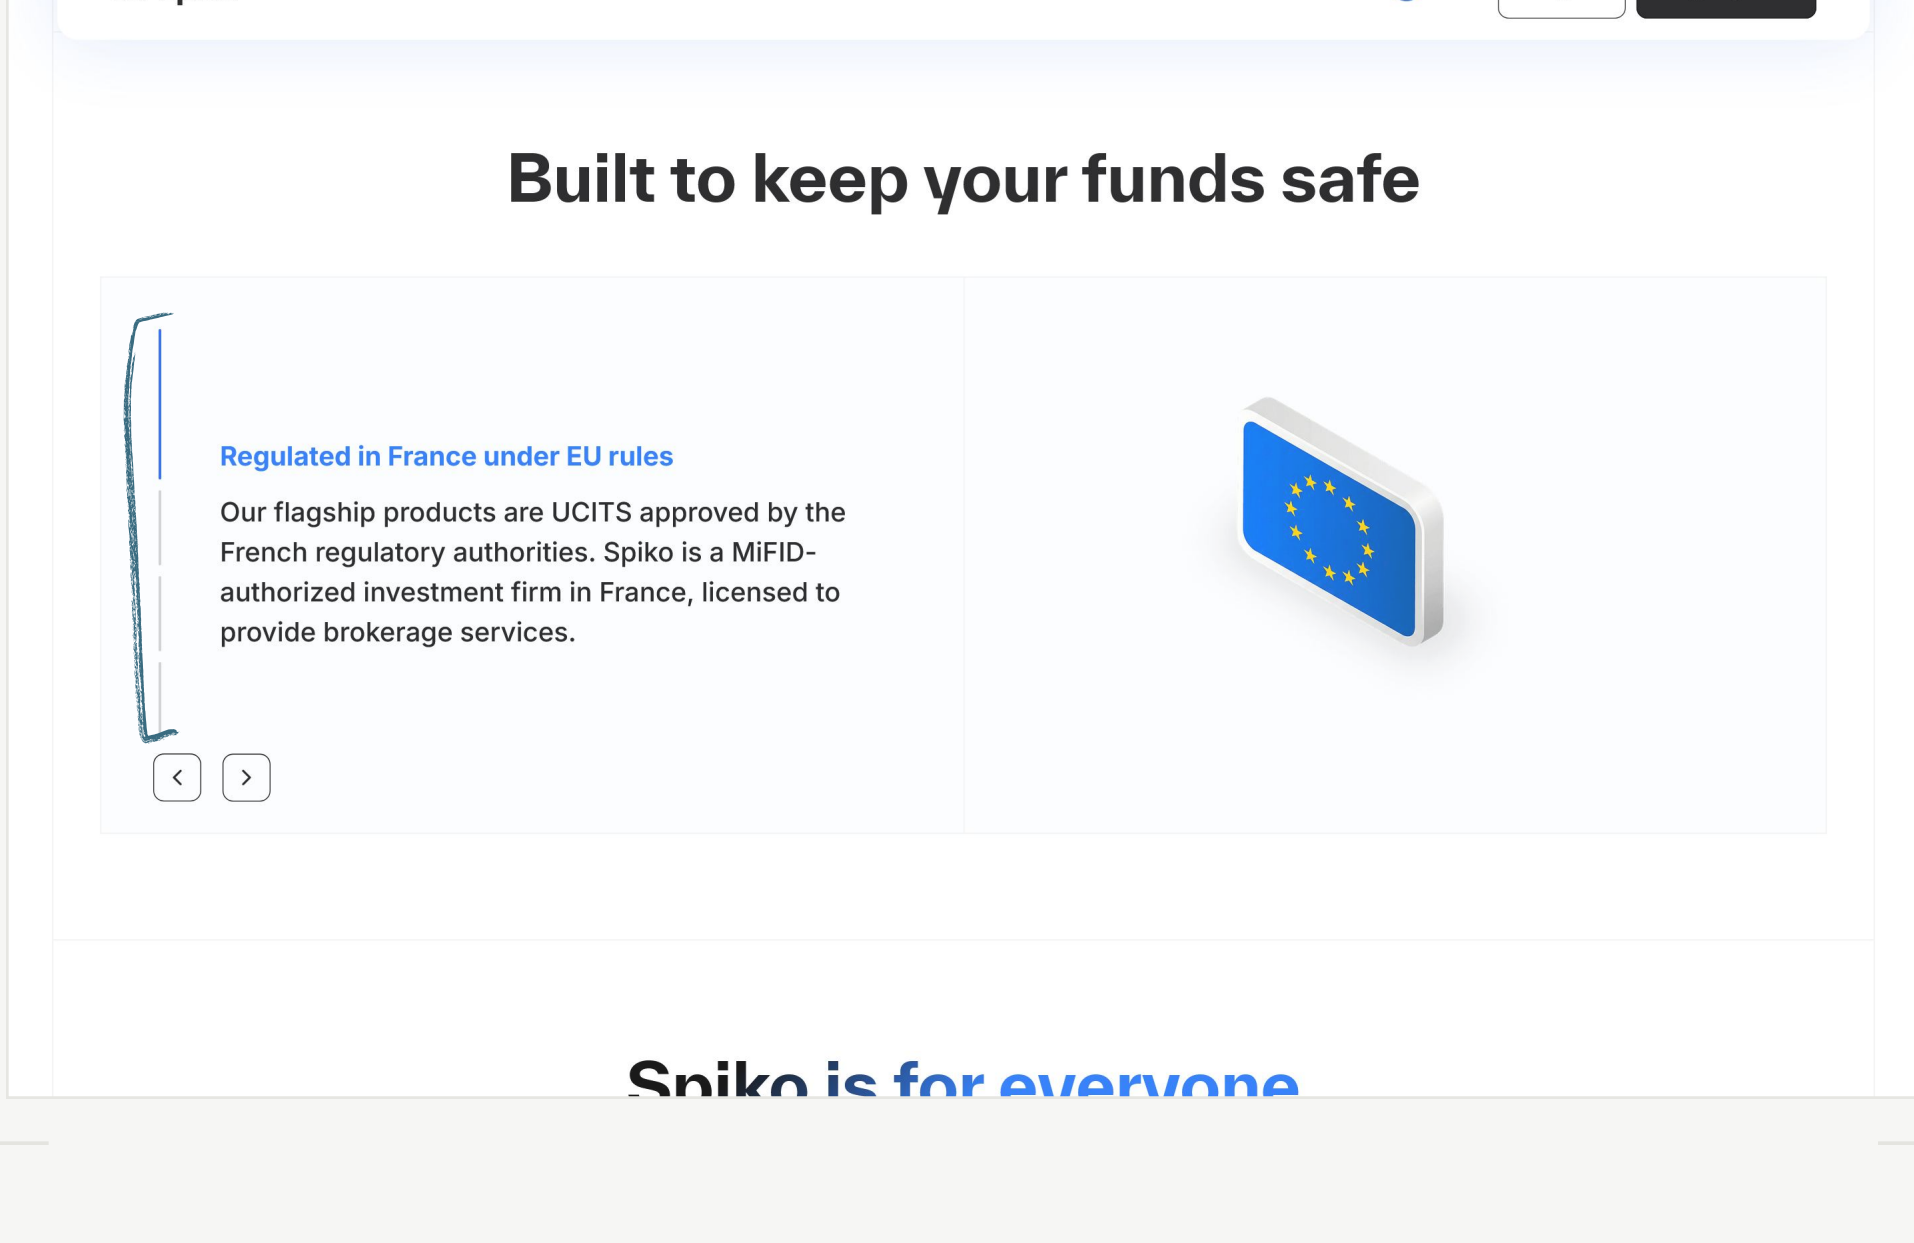

The visitor has to reconcile these signals into a clear picture of whether Spiko is primarily for personal cash, company treasury or another use case.

BUSINESS IMPACT

Ambiguous audience positioning makes it harder for the right visitor to recognise the product as specifically relevant to their workflow.

07-OBSERVATION-06

Trust is substantial but fragmented.

WHAT HAPPENS

Spiko presents security, regulation, UCITS approval, financial figures and organisational proof across several sections of the homepage.

WHY IT MATTERS

The visitor receives many reasons to trust Spiko, but they are presented as separate assurances rather than one clear explanation of how the money is protected.

BUSINESS IMPACT

The page spends substantial attention on credibility without turning that evidence into an equally clear answer to the underlying trust question.

08-CLOSING-THOUGHT

The yield is easy to see. The product still needs to be assembled.

Spiko already makes the financial outcome tangible. The harder part is understanding the system behind it: what happens to the money, who the product is for, what using it costs and how the different trust signals fit together.

The page has the evidence. The opportunity is making the product model as immediate as the yield.

RECOMMENDATIONS

- Clarify the primary action hierarchy on the first screen.
- Make key product behaviour immediately understandable.
- Use familiar currency representations or explain the custom notation.
- Make withdrawal costs explicit alongside the yield.
- Clarify the primary audience and separate personal and business use cases.
- Consolidate trust signals into a clear explanation of how funds are protected.
